**Second Human Case of
West Nile Virus in Jefferson County**

August 12, 2004

CONTACT: Dave Volkel
Environmental Health Services
303-271-5730

GOLDEN – Jefferson County Department of Health and Environment (JCDHE) is announcing today the second confirmed human case of West Nile Virus in Jefferson County for 2004. A Golden, Colorado 67-year old male developed meningoencephalitis July 31, 2004, possibly contracted while visiting the Western Slope during the month of July. He was exposed to numerous mosquitoes during his stay but does not specifically recall being bitten. He remains hospitalized today. JCDHE Environmental Health Services and Communicable Disease Control Program are currently doing follow-up investigation.

“Whether at home in Jefferson County or traveling to the Western Slope, it is important to take precautions against West Nile Virus to avoid mosquito bites”, said Dr. Mark Johnson, Jefferson County Department of Health and Environment’s Executive Medical Director. “The continuing message of wearing DEET, dressing in long pants and long-sleeved shirts, and avoiding outdoor activities during dusk and dawn are important personal protective measures everyone should follow.”

Public health officials remind everyone that although West Nile Virus can be serious, most people will not even know that they have been infected. Signs of the illness usually appear 3 to 14 days after being bitten. Most infections are mild, lasting up to 2 weeks, and symptoms resemble the flu including fever, headache and body aches/weakness. Indications of more severe cases may include headache, high fever, neck stiffness, mental confusion, tremors, muscle weakness, convulsions, and coma. The more severe infections can result in vision changes, hearing loss, movement difficulties, brain damage, permanent paralysis, encephalitis (inflammation of the brain), meningitis (inflammation of the spinal cord and lining of the brain), and even death. **Persons who experience the more severe symptoms should contact their health care provider immediately.**

“Interestingly, there is a lot about this virus that we don’t fully understand, such as why most people experience little or no symptoms while others may develop severe symptoms,” says Barb Mertens, RN Communicable Disease Control Program Coordinator. Therefore, all residents should continue to take measures to protect themselves from mosquito bites by following the 4 Ds:

- **DEET:** Wear insect repellent containing DEET.
 - (The higher percentage of DEET in a repellent, the longer the protection lasts. Choose a product with the right amount of DEET to match the time spent outdoors: 25% DEET lasts up to 5 hours; 5% DEET lasts 45 to 90 minutes. Use products containing 30% DEET or less for children. **Always read the labeled instructions for use.** The American Academy of Pediatrics and other experts suggest that it is acceptable to apply repellent with up to 30% DEET to infants over 2 months old.)
- **DRAIN:** *“With the increased rain, remember to drain”* is the mantra Jefferson County residents need to remember and follow. Drain or empty standing water around your home and neighborhood, in areas such as flower pots, wading pools, bird baths, empty tires and wheelbarrows, since that is where mosquitoes lay their eggs.
- **DUSK/DAWN:** Take extra care to use repellent and protective clothing during evening and early morning (dusk and dawn) or consider avoiding outdoor activities during these times when mosquitoes are most active.
- **DRESS:** Dress in long sleeves and pants during dusk and dawn or in areas where mosquitoes are active.
